PresCal™ Compact pressure reducing valves

Function

Pressure reducing valves are devices which, when installed in water systems, reduce and stabilize the pressure of the water entering from the water supply main. This pressure, in general, is too high and variable for domestic systems to operate correctly.

The PresCal™ Compact 533H series pressure reducing valve, ideal for small system applications, is constructed of a DZR low-lead forged brass body and incorporates a unique noise reducing and high flow seat design. It is easily serviced with a replaceable cartridge and has an integral stainless steel filter (35 mesh), helpful for water systems that may contain sediment or debris. A tamper-resistant cap is included to replace the standard cap to hide the adjustment screw to help prevent set point tampering.

The valve complies with NSF/ANSI 61 (180°F/82°C Commercial Hot) as certified by ICC-ES, and complies with NSF/ANSI 372, low lead, and codes IPC, IRC, NPC and UPC for use in accordance with the US and Canadian plumbing codes, as certified by ICC-ES.

Technical specifications

Materials

- Body: DZR low-lead forged brass EN 12165 CW724R
- Cover: glass reinforced nylon PA6G30
- Control stem: stainless steel EN 10088-3 (AISI 303)
- Moving parts: DZR low-lead brass EN 12164 CW724R
- Diaphragm & seals: peroxide-cured EPDM
- Compensation piston rings: PTFE
- Filter: stainless steel EN 10088-3 (AISI 304)
- Seat: stainless steel EN 10088-3 (AISI 303)
- Shuttle: PPSG40

Performance

Suitable fluids: water

- Downstream pressure setting range: 15 - 80 psi (1 - 5.5 bar)
- Factory setting: 45 psi (3 bar)

- Max working pressure: 250 psi (17.25 bar)
- Max. working temperature: 180°F (80°C)

- Pressure gauge scale: 0 - 100 psi (0 - 7 bar)
- Filter mesh size: 0.51 mm (35 mesh)

Certifications

1. Complies with codes IPC, IRC, UPC and NPC, ASSE 1003, CSA B356 (R2015), and standard NSF/ANSI 61 (180°F/82°C Commercial Hot), as certified by ICC-ES, file PMG-1356.
2. Complies with NSF/ANSI 372, low lead, as certified by ICC-ES, file PMG-1360.
3. PEX crimp fittings certified to ASTM F 1807.
4. PEX expansion fittings certified to ASTM F 1960.

Connections

Main connections:

- NPT female union, sweat union inlet; and NPT female (FNPT) outlet .................................................. ½”
- NPT female union, sweat union, press union, PEX crimp union or PEX expansion union inlet; and NPT female (FNPT) outlet .................................................. ¾”

Pressure gauge connection: ¼” NPT female

Operating principle

Operation of the pressure reducing valve is based on the balance between two opposing forces:

1. The force of the spring towards the opening of the valve.
2. The force of the diaphragm towards the closure of the valve.

Operation with water flow

When a faucet is opened in the water system, the force of the spring becomes greater than that of the diaphragm; the shuttle moves downwards opening the valve to the flow of water. The greater the demand for water the lower the pressure under the diaphragm with a resulting greater flow of water through the valve.

Construction details

Contoured diaphragm
The diaphragm is designed with a special shape to assure more accurate pressure regulation in accordance with downstream pressure fluctuations. This feature also extends the life of the valve, since the diaphragm is more resistant to sudden pressure fluctuations and to normal wear.

Non-stick materials
The central support assembly (1), containing moving parts, is made of plastic material with a low adherence coefficient. This minimizes the formation of lime scale, a common cause of flow inconsistencies.

Stainless steel stem
The stainless steel stem (2) minimizes the harmful affects associated with the use of hard and aggressive water.

Removable cartridge
The cartridge containing the diaphragm, filter, seat and valve plug, shuttle and compensating piston is a pre-assembled self-contained unit with a cover, and can be removed to facilitate inspection and maintenance procedures. The special construction of the regulating element does not require any modification of the pressure setting, which may be left unchanged.

Compact dimensions
The “inclined” configuration makes the PresCal Compact 533H series pressure reducing valves compact for easy installation.
Sizing procedure

Flow velocity is recommended to be kept within 3 to 6 feet per second when calculating the correct pressure reducing valve size. This will prevent noise in the pipes and rapid wear of fixtures. The valve will accurately control pressure down to a velocity of 1 fps.

The correct size of the pressure reducing valve is taken from graph 1 on the basis of the design flow rate taking into account an ideal flow velocity in the valve body of between 3 and 6 f/s (blue band).

Example:
For 8 gpm, select the 3/4" size valve (see arrow on graph 1).

The pressure drop is taken from graph 2 also on the basis of where the design flow rate intersects the curve for the valve size already selected (the downstream pressure falls by an amount equal to the pressure drop, with respect to the set pressure at no flow condition).

Example:
For 8 gpm the Δp = 10 psi (see arrow on graph 2).

Setting

Using a flathead screwdriver turn the screw on top of the plastic cover. Turn it clockwise to increase the pressure and counter clockwise to decrease it.

PresCal Compact 533H series pressure reducing valves are factory set to 45 psi (3 bar).

Installation recommendations

1. Installation below ground
   Installation below the ground is not advisable.

2. Outdoor installation
   Pressure reducing valves should not be installed outside the building unless properly protected from freezing and the weather.

3. Water hammer
   Water hammer is a common reason for pressure reducing valve failures. Specific devices should be installed to absorb water hammer for systems with this risk.

Tamper-resistant cap:
The PresCal Compact 533H series comes with a standard gray snap-on cap which has a hole in the center to allow set point adjustment using a flathead screw driver. Also included is a black “tamper-resistant” cap, which can replace the standard cap, to hide the adjustment screw thus preventing set point tampering.

Troubleshooting

System failures are not always caused by the pressure reducing valve. Most frequently:

1. Increased downstream pressure in the presence of a water heater
   If the downstream pressure increases beyond the desired setting due to an inline water heater, install an expansion tank between the pressure reducing valve and the water heater to absorb the increased pressure, caused by water expansion from heating.

2. The pressure reducing valve does not maintain downstream setting value
   If the pressure reducing valve does not maintain the downstream setting, it most likely is due to impurities accumulating on the valve seat, causing unnecessary flow to pass-through, increasing the downstream pressure. Proper maintenance and cleaning of the removable cartridge is recommended.
SPECIFICATION SUMMARY

533H series
Compact pressure reducing valve with self-contained removable cartridge, certified by ICC-ES to ASSE 1003, CSA B356 (R2015), NSF/ANSI 61 (180°F/82°C Commercial Hot), NSF/ANSI 372 Low lead compliance. Meets codes IPC, IRC, UPC and NPC for use in accordance with the US and Canadian plumbing codes. Sizes ½" with NPT female union or sweat union inlet connections and integral NPT female outlet, sizes ¾" with NPT female union, sweat union, press union, PEX crimp union, or PEX expansion inlet connections and integral NPT female outlet connection. PEX crimp fittings must comply with ASTM F 1807. PEX expansion fittings must comply with ASTM F 1960. Dezincification resistant low-lead forged brass body (<0.25% Lead content) certified by and listed by ICC-ES. DZR low-lead brass internal moving parts. Cover in glass reinforced nylon PA6G30. Stainless steel filter, mesh size 0.51 mm (35 mesh). Peroxide-cured EPDM membrane and sealing gaskets. PTFE compensating piston rings. Maximum working temperature 180 degrees F (80 degrees C). Maximum upstream pressure 250 psi (17.25 bar). Downstream pressure setting range from 15 psi to 80 psi (1 bar to 5.5 bar). Self-contained cartridge removable for maintenance purposes. Equipped with operating knob with manual setting with adjustment screw. Provided with tamper-resistant cap for optional use. Provide with optional pressure gauge with 0 psi to 100 psi (0 bar–7 bar) pressure scale. Pressure gauge connection 1/8" NPT male.
